ft lb	1.3558181	Nm
°F	5/9 (°F-32)	°C

The Consolidated® Series 3500 Electromatic Ball Valve is designed to provide automatic or manual over-pressure protection for steam boiler systems, and can also be used to assist start-up and shut-down venting.

<b>INLET SIZES</b>	1.5" (38.1 mm), 2" (50.8 mm) and 2.5" (63.5 mm) in either flanged or weld neck design.
<b>INLET RATINGS</b>	ANSI Class 1500 thru 4500.
<b>OUTLET SIZES</b>	3" (76.2 mm) and 4" (101.6 mm).
<b>OUTLET RATINGS</b>	ANSI Class 300 and 900.
<b>BORE SIZES</b>	.875" (22.23 mm) through 2.000" (50.8 mm). Reduced bores are available.
<b>TEMP. RANGE</b>	To 1150°F (621.1°C).
<b>MATERIALS</b>	Alloy steel body with Inconel alloy seat and ball.
<b>CERTIFICATION</b>	ASME B & PVC Section I 'V' code Stamp on once through boilers and Non-code Section.

## Features & Benefits

The 3500 Electromatic Ball Valve:

- Technologically advanced ball & seat coating increases life expectancy
- Superior stem design provides structural integrity in extreme environments
- Versatile design allows for omni-directional assembly

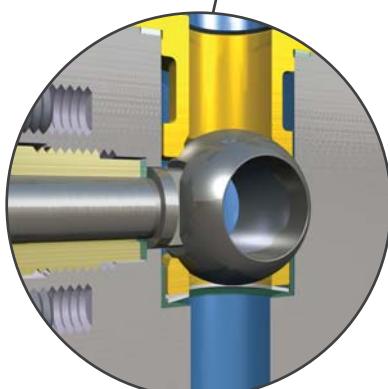

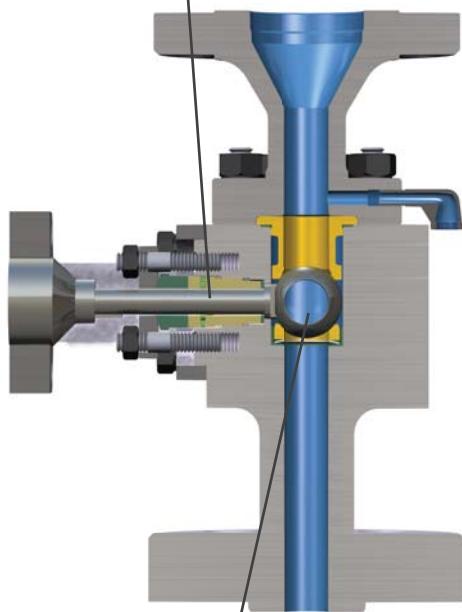

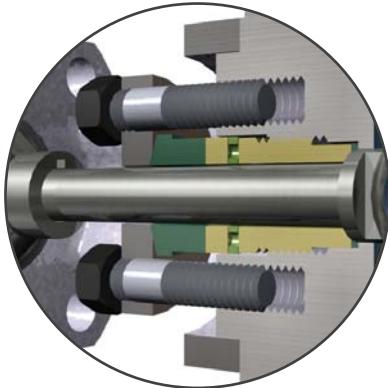

The Consolidated® Series 3500 Electromatic Ball Valve (EBV) is designed to provide automatic or manual over-pressure protection for steam boiler systems. Set to operate at a lower pressure than the spring-loaded safety valves, the EBV substantially reduces safety valve maintenance and increases boiler efficiency. The EBV should be sized as part of the safety valve boiler package in order to ensure safe performance. This can be accomplished using a Consolidated® 3500 EBV because the proper seat bore diameter is selected to match the optimum capacity requirement. Where open/close actuation is acceptable, the EBV can also be used to assist with start-up and shut-down venting

### Guided Yoke Design

This preferred design is rugged and ensures positive and precise guiding of the actuator, stem and ball. The weight of the actuator is fully supported by the yoke; and by removing the side loading on the stem, excessive wear is eliminated on the packing, stem and actuator.

# Features & Benefits

3500 Series Electromatic Ball Valve

## Gland, Stop Ring and Packing

The stuffing box arrangement has been designed specifically to take advantage of the sealing properties found in expanded graphite. This design provides for a stable low maintenance operation that eliminates the need for frequent packing adjustments. Live loading of the packing with washers is not necessary.

## Stem and Bearing Washer

As a special feature, both the stem and bearing washer are chrome carbide coated. The chrome carbide coating provides gall resistant stem guiding for a maximum wear life. Stem rotation remains easy even at high pressures and temperatures. Packing migration is kept to a minimum.

## Stem Retaining Nut

The threaded stem nut retains the stem and protects against blowout. This top entry design allows the stem to be a single piece that improves alignment between the ball and actuator.

## Ball, Seat, and Seat Loader Assembly

The ball, seat, and seat loader is Colmonoy coated which helps to prevent damage caused by abrasives in the steam flow. Also a wiping action occurs as the valve opens and closes which further protects the seats. The ball and seat are made from Inconel in order to fight thermal stress cracking, and to improve seat tightness. To further extend the service life of the valve, the 'seat, ball, and seat loader assembly' is replaceable in the field.

## Seat and Body Joint Seal

When it is time to repair the EBV, the 'seat, ball and seat loader assembly' can easily be replaced by removing the outlet flange from the valve body. The seat/body joint seal is made of expanded graphite. Expanded graphite provides positive sealing and there is little or no need for lapping surfaces, taking critical measurements and making fine adjustments. This proven method of sealing is also the method with the lowest replacement cost.

# Features & Benefits (Contd.)

## LEDEEN® Actuator

The LEDEEN actuator is a high quality scotch yoke actuator with several design features not typically found on pneumatic actuators installed in power stations. The rugged frame of the Ledeen actuator is its foundation and is well suited for developing and transferring torque to the valve. Furthermore, the frame is non-pressurized and it is totally weatherproof. This ensures that the rotary seals on the output shaft will not contribute to a pressure leak that would require unexpected maintenance.

Inside this frame, every mechanism that slides or rotates during operation has a low friction bushing to efficiently support its movement. In addition, the square slide blocks within the yoke are distinctive and provide a significant stress reduction when transferring the linear input force of the piston into the rotary output of the yoke.

In the pneumatic cylinder, a cap seal assembly is utilized on the piston and piston rod. This unique seal design provides a dependable pressure seal specifically designed for dynamic applications that vary widely in operation from low frequency to high frequency. The combination of this seal design with the non-corrosive sealing surface of the cylinder and piston rod ensures extended maintenance free performance. All of the above features on the Ledeen actuator are intended to provide for a long service life.

# Features & Benefits (Contd.)

## Control Package

Several items have been added to the control package. The positioner monitor is an explosion proof (NEMA 4, 4X, 7, 9 rated) aluminum enclosure and is equipped with two mechanical switches and a high visibility monitor for instant recognition of valve position up to distances of 150 feet (45.72 m). The solenoid valves are mounted directly onto the position monitor housing. This package has the option of adding additional switches should a customer want to send a valve position signal to his DCS or other remote location.

## System Components

(Figure 1) illustrates the relationship of the various components of the Consolidated® Electromatic Ball Valve System. The Electromatic Ball Valve (EBV) is usually mounted on the super heater outlet header, the controller close to the boiler and the control station on the boiler control panel board. The Electromatic Ball Valve is normally set at a pressure lower than the spring-loaded safety valves where it can substantially reduce safety valve maintenance and improve boiler efficiency.

## Electromatic Ball Valve (Type 3500)

The Consolidated® 3500 EBV is an automatic, power actuated, pressure relief and venting valve. A double acting air actuator is the standard actuation package. The estimated (open, close) cyclic action is 2 seconds.

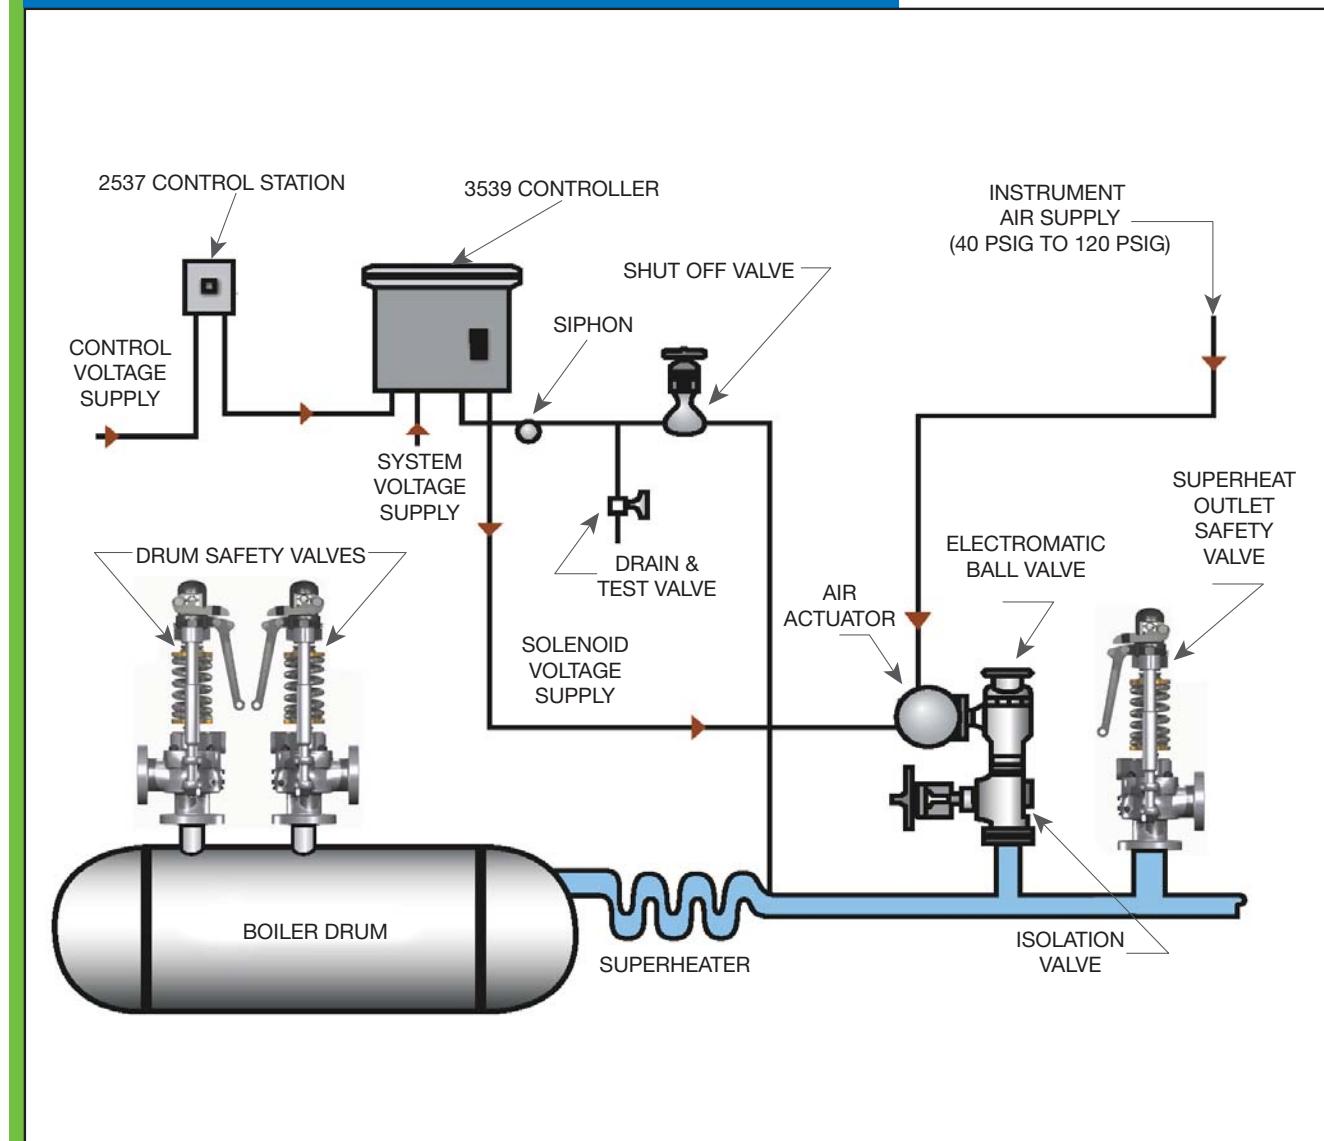

## Controller (Type 3539)

(Figure 2) The standard control package consists of a dual control pressure switch comprised of a bourdon type sensing element that actuates two micro switches and a heavy duty relay switch. When the predetermined set point of the valve is reached, the relay switch closes and transmits electric current to two three-way solenoid valves located on the actuation package. With the solenoid valves energized, the EBV opens. When the pressure decreases below the adjusted closing point of the valve, the relay opens which de-energizes the solenoid valves and causes the EBV to close.

On request, the actuator can be controlled by the customer's distributive control system(DCS). Customers can also submit their own control package for review by Dresser Engineering.

# Features & Benefits (Contd.)

Figure 1: 3500 Electromatic Ball Valve with Standard Control Package

# Features & Benefits (Contd.)

## Control Station (Type 2537)

(Figure 3) The control station, which includes a switch and two lights, is a small unit that can be mounted on the control panel. The control station is electrically connected to the controller. The control station is a three-position electric switch: off, automatic or manual.

With the control station switch in the automatic position, the amber light turns on indicating valve closed and remains on until the valve is opened. When the system pressure reaches the set pressure the valve opens, the amber light turns off, and the redlight turns on indicating valve open. When the system pressure decreases to the closing pressure, the valve closes, the red light is turned off and the amber light is turned back on indicating valve closed.

When it is desirable to open the valve manually, this can be accomplished by simply pushing the control station switch to the manual position. To close the valve, it is only necessary to push the switch to the off position.

## Isolation Valve

Valve A special isolation valve is used to isolate the 3500 Electromatic Ball Valve. It must be the correct size and not restrict the capacity of the Electromatic Ball Valve. The valve is used to isolate the EBV in the event of leakage. The isolation valve is normally in the open position during startup. Contact the factory for an isolating ball valve or an isolating gate valve quotation.

# Materials (Contd.)

## Options

Pressure Regulator and Filter

Note: Pressure regulator & filter are required prior to 3500EBV actuator. A quotation for a filter regulator can be provided on request.

Auxiliary Supply Manifold

Note: When an alternate or backup is required to the instrument air supply, an auxiliary supply manifold can be quoted. The auxiliary supply can be connected to a secondary air supply or nitrogen bottle. In the event that the regulator on the auxiliary supply pressure fails, a rupture disc is supplied as standard on the auxiliary supply manifold.

# Orifice Capacities

## System Components

The 3500 Series Electromatic Ball Valve is supplied with standard orifice bores. Capacity tables on pages 3500EBV.17 through .22 specify the relieving capabilities of these valves with a maximum or standard orifice size. Orifice sizes smaller than standard may be specified to reduce the capacity to less than that stated in the capacity tables.

Dresser, Inc. recommends that the 3500 EBV be sized as an integral part of the total safety valve system in order to ensure that the safety valves operate properly and within ASME requirements for set pressure, lift and blow down. Total system sizing is not included in the following examples. For total system sizing, refer to Safety Valve Product Information Sheet SV/PI-53, or submit the total information required in the "Ordering Information" section to the factory for review.

## Example 1

For a new installation with no piping connections specified:

**Set Pressure: 2000 psig (137.89 barg)**

**Required Capacity: 90,000 pph steam @  
1000°F and 3% over pressure  
Non-ASME Section I rated**

### Step 1

Determine the saturated capacity and full bore size from the appropriate capacity tables on pages 3500EBV.17 through .22. The selected capacity should be greater than or equal to the required capacity. If not, select the next larger bore size.

Page 3500EBV.18 "Capacity Tables"

1.750 Bore, 2.5" (63.5 mm), 35\_7

Capacity at 2000 psig (137.89 barg) = 258,364 pph  
saturated

258,364 pph ≥ 90,000 pph

Select #7 orifice designation

### Step 2

Correct for superheated steam temperatures using the "Superheat Correction Factors" on page 3500EBV.26. Convert the set pressure from psig to psia flowing pressure then determine the superheat correction factor at the relieving temperature (interpolate when necessary). Multiply the saturated steam capacity calculated in Step 1 by the selected correction factor. The calculated capacity should be greater than or equal to the required capacity. If not, repeat Step 1 and select a larger bore size.

"Superheat Correction Factors"

PSIA = (2000 psig (137.89 barg) × 1.03) + 14.7 = 2074 psia

2074.7 psia @ 1000°F = 0.760 SHCF

0.760 × 258,364 pph = 196,396 pph

196,396 pph ≥ 90,000 pph

### Step 3

Determine any required reduction in capacity or bore size. Calculate the percentage of required capacity versus the full capacity as calculated in Steps 1 and 2. Using the section titled "Reduced Bore Selection and Capacity Factor" on page 3500EBV.23, refer to the table that corresponds to the full bore size selected. From the column marked "Relation to 100%", select the percentage that is equal to or greater than the calculated percentage. Multiply the full capacity corrected for temperature by the capacity factor selected. The reduced bore capacity should be greater than or equal to the required capacity.

Required capacity / Full bore capacity @ 1000°F

90,000 pph / 196,396 pph = 45.8%

Page 3500EBV.23 "Reduced Bore Selection and Capacity Factor",

1.750 Bore, 2.5" (63.5 mm), 3517, 3527 3537 & 3547

46% ≥ 45.8%.

46 × 196,396 pph = 90,342 pph

90,342 pph ≥ 90,000 pph

Select 1-3/16 Reduced Bore

### Step 4

Verify "Pressure Class" using page 3500EBV.14 for "Maximum Pressure and Temperature" for 3500 EBV.

2000 psig (137.89 barg) @ 1000°F, 1.750 Bore (#7 designation)  
2.5" (63.5 mm) 3527F, 2170 psig (149.62 barg) > 2000 psig  
(137.89 barg)

or

2.5" (63.5 mm) 3537W, 3000 psig (206.84 barg) >  
2000 psig (137.89 barg)

### Step 5

Review section titled "Scope of Design" on Page 3500EBV.1.

## Replace With

3527F = 2500 Class, 2.5" (63.5 mm) 2500 Class Flange x 4"  
(101.60 mm) 300 Class Flange

Reduced bore from 1.750 to 1-3/16

Set 2000 psig 90,342 pph @ 1000°F

or 3537W = 3000 Class, 2.5" (63.5 mm) Butt weld x 4"  
(101.60 mm) 300 Class Flange

Reduced bore from 1.750 to 1-3/16

Set 2000 psig (137.89 barg) 90,342 pph @ 1000°F

# Orifice Capacities (Contd.)

## Example 2

For replacement valve selection when valve type and/or a serial number is provided:

Replace a 2.5" (63.50 mm) 2533VX (15) - XI S/N BV03275  
Set 1200 psig (82.74 barg)  
Required capacity is 100,856 pph at 900°F  
3% overpressure 100% of Actual Capacity –  
Non-ASME Section I Rated  
Full 1.625" (41.28 mm) bore, 1500 Class Inlet Flange

### Step 1

Review section titled "Scope of Design" on page 3500 EBV.1.

3517F, 1500 Class, Bore 1.750, 2.5" (63.50 mm)  
1500 Class Flange x 4" (101.60 mm) 300 Class Flange

### Step 2

Verify "Maximum Pressure Temperature Limits" on page 3500 EBV.14. Maximum pressure for valve selected at a given temperature must be greater than or equal to the set pressure of the valve being replaced.

Page 3500 EBV.14  
for 3517F @ 900°F (482.2°C) = 2245 psig (154.79 barg)  
2245 psig (154.79 barg) ≥ 1200 psig (82.74 barg)

### Step 3

Verify capacity in section titled "Capacity Tables" on pages 3500EBV.17 through .22.

Page 3500 EBV.18 1.750 bore, #7 orifice designation, 2.5" (63.50 mm), 3517 at 3% over pressure 100% of actual capacity - non-ASME Section I rated. At 1200 psig (82.74 barg) set pressure = 150,834 pph saturated steam capacity.  
150,834 pph ≥ 100,856 pph

### Step 4

Correct for superheated steam temperatures using the "Superheat Correction Factors" on page 3500 EBV.26. Convert psig to psia. Select correction factor for set pressure psia at the required relieving temperature and multiply saturated steam capacity calculated in Step 3 by correction factor. Verify it is greater than or equal to the required capacity.

$$\begin{aligned}1200 \text{ psig (82.74 barg)} &= (1200 \times 1.03) + 14.7 = 1250 \text{ psia} \\1250 \text{ psia} @ 900^\circ\text{F (482.2°C)} &= .804 \text{ SHCF} \\.804 \times 150,834 \text{ pph} &= 121,270 \text{ pph} @ 900^\circ\text{F (482.2°C)} \\121,270 \text{ pph} &\geq 100,856 \text{ pph}\end{aligned}$$

### Step 5

Select reduced bore if required. Calculate the percentage of required capacity versus the full bore capacity as calculated in Step 4. Using the section titled "Reduced Bore Selection and Capacity Factor" on page 3500 EBV.23, refer to the Tables that corresponds to the 1.750 full bore size selected. From the column marked "Relation to 100%", select the percentage that is equal to or greater than the calculated percentage. Multiply the full capacity corrected for temperature by the capacity factor selected. The reduced bore capacity should be greater than or equal to the required capacity.

Required capacity / Full bore capacity @ 900°F (482.2°C)  
100,856 pph / 121,270 pph = 84%  
Select 1.625" (41.28 mm), 86.2% ≥ 84%  
Use 3517F with 1.625" (41.28 mm) reduced bore  
121,270 pph (full bore capacity) × .862 = 104,534 pph  
104,534 pph ≥ 100,856 pph

### Replace With

2.5" (63.50 mm) 3517 F-1-X1, 2.5" (63.50 mm)  
1500 Class Flange x 4" (101.60 mm) 300 Class Flange with  
1.625 (41.28 mm) Reduced Bore  
Set 1200 psig (82.74 barg)

# Orifice Capacities (Contd.)

W= Slope x P for P ≤ 1580 psia  
 $P = (1.03 \times \text{set pressure}) + 14.7$

$W = \text{Slope} \times P \times \begin{cases} 0.1906 \times P - 1000 \\ 0.2292 \times P - 1061 \end{cases}$  For P > 1580 psia

Valve Capacity - Non-ASME Code Rated, for Saturated Steam. The saturated steam table for Non-ASME Section I is based at 3% overpressure or 2 psig (0.14 barg), whichever is greater, showing 100% actual capacity.

## Notes:

- The minimum set pressure is 50 psig (3.45 barg). For set pressures 50 psig (3.45 barg) to 99 psig (6.83 barg) contact the factory.

# Orifice Capacities (Contd.)

W= Slope x P for P ≤ 1580 psia  
 $P = (1.03 \times \text{set pressure}) + 14.7$

W = Slope x P x  $\left[ \frac{0.1906 \times P - 1000}{0.2292 \times P - 1061} \right]$  For P > 1580 psia

Valve Capacity - Non-ASME Code Rated, for Saturated Steam. The saturated steam table for Non-ASME Section I is based at 3% overpressure or 2 psig (0.14 barg), whichever is greater, showing 100% actual capacity.

## Notes:

- The minimum set pressure is 50 psig (3.45 barg). For set pressures 50 psig (3.45 barg) to 99 psig (6.83 barg) contact the factory.

# Orifice Capacities (Contd.)

W= Slope x P for P ≤ 1580 psia  
 $P = (1.03 \times \text{set pressure}) + 14.7$

$W = \text{Slope} \times P \times \begin{cases} 0.1906 \times P - 1000 \\ 0.2292 \times P - 1061 \end{cases}$  For P > 1580 psia

Valve Capacity - Non-ASME Code Rated, for Saturated Steam. The saturated steam table for Non-ASME Section I is based at 3% overpressure or 2 psig (0.14 barg), whichever is greater, showing 100% actual capacity.

### Notes:

- The minimum set pressure is 50 psig (3.45 barg). For set pressures 50 psig (3.45 barg) to 99 psig (6.83 barg) contact the factory.

# Orifice Capacities (Contd.)

$$W = 1135.8 \times \frac{0.9}{51.45} \times \text{Slope} \times \sqrt{\frac{P}{V}}$$

$$P = (\text{Set} \times 1.03) + 14.7$$

Slope = 120.6

V = Specific Volume

For Non-Code applications multiply capacity by 1.1

Valve Capacity, ASME B&PV Code Section I, for Supercritical Steam Applies to Valve 3547

### Notes:

1. Full Bore comparison for this bore size

# Orifice Capacities (Contd.)

## Reaction Forces

Illustrated to the right is a Consolidated® Electromatic Ball Valve. When the valve is closed, an upward force is exerted in the valve neck ( $F_P$ ), due to valve internal pressure. Valve necks are designed to resist the force and circumferential stresses due to valve internal pressure.

When the valve opens, the force remains constant until some over pressure occurs. The force resulting from set pressure plus overpressure ( $F_{SP}$ ) must be balanced by resisting forces in the valve neck.

Once flow has been established, the steam escapes upward through the discharge connection; this results in force ( $F_R$ ) acting downward at the center line of the discharge pipe.

Force  $F_R$  is represented by the equation:

$$F = MV + PA$$

A = Area of outlet, sq. in.

$$M = \frac{W}{g} = \frac{\text{lb/sec}}{\text{ft/sec}^2} = \frac{\text{lb - sec}}{\text{ft}}$$

P = Static pressure, lb/sq.in

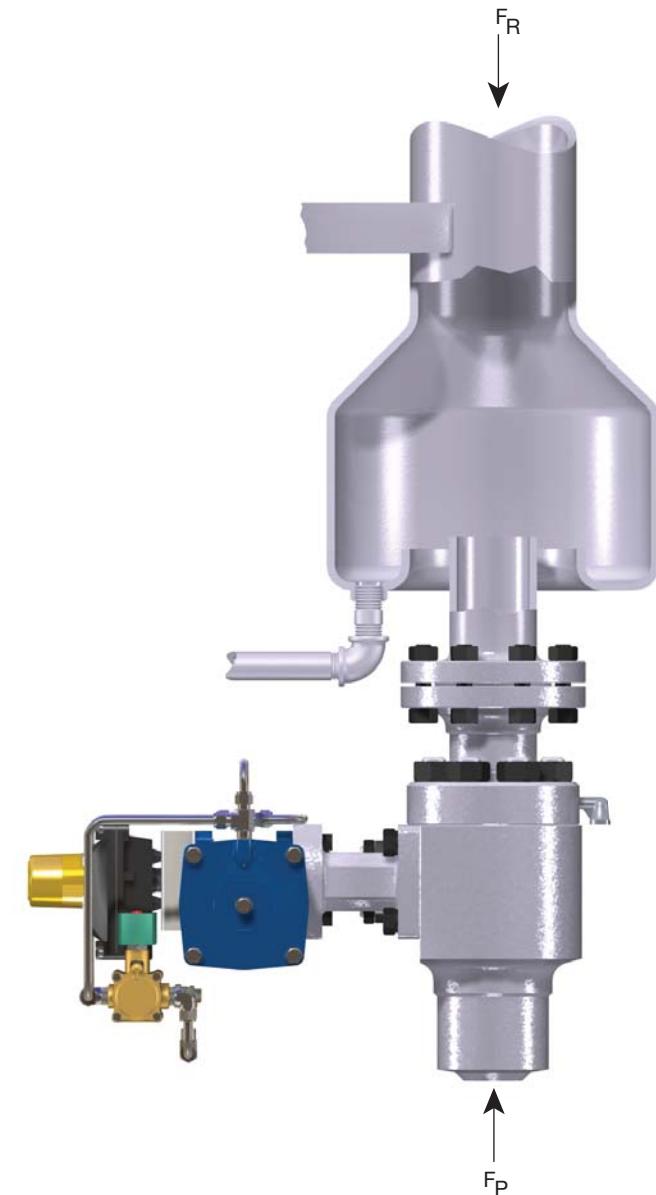

V = Velocity, ft/sec

In addition to actual valve capacities, reaction force valves are based on pressure, temperature, and valve configuration. Forces for a particular valve type will apply regardless of inlet connection used; i.e. flange, screwed, or welded.

For valve installations which vent to a closed system or solidly piped discharge lines, changes which occur in reaction forces, and the effects on nozzles, headers, and discharge lines should be considered.

Force values indicated apply only when valves have been installed in accordance with ASME Code or Dresser Maintenance Manual recommendations.

Typical Vertical Discharge Consolidated® Electromatic Ball Valve

### Notes:

- For capacity on superheated steam, multiply saturated steam capacity by correction factor.
- Convert set pressure from (psig) to flowing pressure (psia)

\*flowing pressure (psia) = [set pressure (psig) x overpressure] + 14.7

# Valve Configuration Code

Standard Valve Connection						
Inlet Size	Designation	Orifice Size	Bore	Area		
in.	mm	in.	mm	Type	in <sup>2</sup>	cm <sup>2</sup>
1.50	38.1	5	.88	FB	0.601	3.877
2.00	50.8	6	1.00	FB	0.785	5.065
2.50	63.5	7	1.75	FB	2.405	15.516
2.50	63.5	7	2.00	FB	3.142	20.271
1.50	38.1	5, 6, 7	Reduced Bore Size <sup>1</sup>	RB	Variable	
2.00	50.8	5, 6, 7	Reduced Bore Size <sup>1</sup>	RB	Variable	
2.50	63.5	5, 6, 7	Reduced Bore Size <sup>1</sup>	RB	Variable	

## Notes:

- Reduced Bore diameter indicated in valve code as represented by xxxx above.

## Pressure Class Flanged Inlet

Designation	Class
1	1500#
2	2500#
Buttweld Inlet	
2	2658# LTD
3	3092# LTD
4	4500# LTD

Inlet Type	
Designation	Type
F	Flanged
W	Buttweld

Inlet Flange Facing	
Designation	Facing
X1	Raised Face Spiral Serrated
X2	Raised Face Smooth
X3	Ring Joint
X4	Large Tongue
X5	Large Groove
X6	Small Tongue
X7	Small Groove
X8	Large Female
X9	Large Male

Bore Type	
Designation	Type
FB	Full Bore
RB	Reduced Bore

## Interchangeability Number

Designation	Valve Type
1	Primary Design Release

## Actuator Type

Designation	Type

SY1043	Ledeen: SY1043

# How to Order a 3500 Safety Valve

## How to Order a 3500 Safety Valve

### Please Specify:

Type of Application	Valve Supplemental Data
a) Superheater _____	a) Special Cleaning _____
b) Other _____ (identify)	b) Special Boxing _____
Applicable ASME Code	c) Export Boxing _____
a) Section I - Power Boiler	d) Special Painting _____
b) Section VIII - Pressure Vessels	Available Air [(40-120 psig) (2.76-8.27 barg)]
C) Non Code	Max. _____ psig _____ barg
System Parameters	Min. _____ psig _____ barg
a) Design Pressure _____ psig _____ barg	Electrical Requirements
b) Design Temperature _____ °F _____ °C	AC _____
c) Operating Pressure _____ psig _____ barg	Hz _____
d) Operating Temperature _____ °F _____ °C	DC _____
Valve Specifications	Control Preference
a) Valve Set Pressure _____ psig _____ barg	2537 Control Station _____
b) Allowable Overpressure on Valve _____ %	2539 Controller _____
c) Required Relieving Capacity _____ lb/hr _____ kg/hr	Transmitter Controller _____
d) Butt weld Valves	DCS _____
Inlet Size _____	Other (specify) _____
Inlet Specifications _____	Safety Valve Information
Outlet Size & Flange Rating _____	a) Total Generating Capacity of the Boiler
e) Flanged Valves	b) Drum Safety Valve Capacities
Inlet Size & Flange Rating _____	c) Superheater Safety Valve Capacities
Outlet Size & Flange Rating _____	d) Drum Operating Pressure
f) Other Type Connections Other Than	e) Superheater Operating Pressure
Buttweld or Flange _____	f) Set Pressure of Low Set Drum Safety Valve
g) Special Codes or Standards _____	g) Set Pressure of Low Set Superheater Safety Valve
h) Model and Manufacturer of Isolation Gate Valve (if any) _____	
i) Model No. and Nameplate data of valve being replaced _____
